                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Bennich enumeration; reduced
                        Claim 8(3); 21pp; English.
It is coded for by a DNA sequence isolated by using sera
infected with EBV to screen colonies of micro-organisms t
fragments of EBV DNA.

                                                                                                                                                                                   P90460
                                                                                                                                                                                                                     DNA encoding snake venom fibrolase
- for use as thrombolytic agent.
Disclosure; fig 8; 41pp; English.
Alpha-factor profibrolase fusion construct (see N90243) of
plasmid pxS308. Used as a thrombolytic agent to treat
vertebrates, esp. humans. Produced by recombinant techniques.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Constructing new polyester biopolymers - using genes encoding beta-ketothiolase(s), acetoacetyl-CoA reductase(s) and polyhydroxybutyrate synthetase(s).

Disclosure; p; English.

The enzyme is used to study the polyhydroxybutyrate (PHB) biosynthetic pathway. It catalyses the reduction of acetoacetyl CoA to form D(-)-beta-hydroxybutyryl-COA, the substrate for PHB synthetase, and can be used to control biopolymer syntheses and produce new biopolymers. The sequence was deduced from the DNA sequence.

Inducting immune response with complex of epitope contg molecule and rotavirus VP6 inner capsid protein as carrier, attached and rotavirus VP6 inner capsid protein as carrier, attached without chemical coupling agent

SC claim 9; Page 22; 30pp; English.

This peptide is found to bind to rotavirus protein VP6. It is considered from rotavirus VP3 protein. Ability to bind is due to considered from rotavirus VP3 protein. Ability to bind is due to considered from rotavirus VP3 protein. Ability to bind is due to considered from rotavirus VP3 protein and an Arg in the 3-D protein. The spatial arrangement of a Cys and an Arg in the 3-D protein. The spatial arrangement of a compsn for inducing immunological coupled to an epitope-bearing molecule via a binding sequence. Coupled to an epitope-bearing molecule via a binding sequence. See also P81997 and P81999-P82000).

See also P81997 and P81999-P82000).

Gee also P81997 and P81999-P82000) and avoids converse effects or antigenicity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        P81999

polypeptides involved in expression of glycopeptide antibiotic presistance - useful in diagnosing presence of Gram-positive resistance - useful in diagnosing presence of Gram-positive resistance - useful in diagnosing presence of Gram-positive resistance strains e.g. Enterococcus faecium and E gallinarum from the plasmid prise from the ded., 319:157-161). The vans protein is part of a two component (regulatory system for controlling the amount of expression of the regulatory system for proteins VanH, VanA and VanX. The other component of the regulatory system is the VanR transcription regulator. VanS protein can modify phosphorylation of VanR in transcription. See also Q251/8-Q25183.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             14-JAN-1986; U02756.

used in therapy of fracture or osteoporosis

claim 2; Fig 4; 28pp; English.

A Xenopus laevis unfertilised egg cDNA library in lambda gtl0 was screened with a PstI-HindIII fragment of X.laevis Xarl4 chromosomal screened with a PstI-HindIII fragment of X.laevis Xarl4 chromosomal DNA. Three clones were isolated, including clone Xbr22 which was found to encode a protein having homology with X.laevis BMP-2A. They were subcloned in pUC19 and used to transform competent E.coli HB101 cells. Transformant E.coli HB101/pxbr22 coding for the BMP-2A was sequenced and the amino acid sequence of BMP-2A deduced from it.

                  DNA molecules corresponding to all or part of the RNA of rhinovirus strain HRV89 (Fig 4, N81390) is claimed, esp. the portion encoding the viral proteins VPI-VP4, P2A-P2C, P3A-P3C. Also claimed are the polypeptides encoded by any of these DNA molecules. The polypeptides are used for stimulating a protective immune response and for blocking cellular receptors. Ab are useful for assay and for purifice. of the corresp. antigen, and can also be used for the therapeutic and diagnostic applications.
                                                                                                                                                                                                                                                                                                                                                                                                               EP-261403-A.

Claim 32; Page 57; 74pp; English.

This is the sequence of bovine respiratory syncytial virus (BRSV) strain AS1908 M2 protein. It can be used in the detection of BRSV antibodies and in vaccines to prevent infection. It can also be used for the production of BRSV protein antibodies.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example; Fig 20; 66pp; German.

DNA molecules corresponding to all or part of the RNA of rhinovirus strain HRV9 (Fig 4, N81390) is claimed, esp. the portion encoding the viral proteins Vpl-Vp4, P2A-P2C, P3A-P3C. Also claimed are the polypeptides encoded by any of these DNA molecules. The polypeptides are used for stimulating a protective immune response and for allocking cellular receptors. Ab are useful for assay and for purificen of the corresp. antigen, and can also be used for the therapeutic and diagnostic applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  17-JAN-1987; DE-701301

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        301
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 51
                                                                                                                                                       bacteria or plants, acetyl CoA reductase is an enzyme pisclosure; fig 3; 64pp; English.

This Alcaligenes eutrophus acetyl CoA reductase is an enzyme which is essential to the biosynthesis of polyhydroxyalkanoate which is essential to the biosynthesia of plasmid clone, (PHA). The gene encoding this is contained in plasmid clone, (PHA), downstream from the thiolase gene. The use of recombinant methods for producing such enzymes, required for polyester biopolymer synthesis, allows for the control and modification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                      17 APR-1991 (first entry)
Acetoacetyl CoA reductase enzyme.
Polyester biopolymers; polyhydroxybutyrate; polyhydroxy
beta-ketothiolase; acetoacetyl CoA reductase.

               The CCP-1 coding sequence was isolated from the amino acid sequence of CCP-1 was predicted from the CDA sequence of the Sequence was solated from the cytotoxic T-cell Title CRP-1 coding sequence was isolated from the cytotoxic T-cell Pile MTL 2.8.2 generated from CDA sequence. The structure of the protein was used to design peptides which competitively inhibit the protease. See also 012863-6 and RI3254-RI3262.

Disclosure; Fig. 9; 49pp; English.
Band 3 is the major glycoprotein of mammalian erythrocytes and functions as an anion antiport in that it mediates the 1-for-1 exchange of chloride (Cl.) and bicarbonate (HCO3-) across the erythrocyte plasma membrane. The anion transport protein may be used in the detection of genetic defects resulting in abnormal transport of ions across cell membranes, e.g. as in cystic fibrosis. N60550 and p60644.

New DNA sequences which act as oligo:nucleotide primers - assaying DNA sample from respiratory secretion of a patien infected with p carinii
Claim 3; Fig 3; 42pp; English.
The amino acid sequence is that of P. carinii NADH dehydro abonit 2 which was translated from DNA from plasmid pAZI: Sequence 482 AA;

carinii NADH dehydrogenase NA from plasmid pAZ112. See

The 32 kD protein may be transcribed from the first reading frame of the "mba" fragment of virulent plasmid pKDSC50 from nucleotide 1159-2052. Three other proteins may also be transcribed from the Salmonella "mba" fragment, which is capable of causing mouse bacteremia. See also R23005-7.

CC within the scope of the invention, this sequence was used to illustrate a novel method of modifying DNA. DNA libraries certain the scope of the invention product and be used to determine the susceptibility of a particular crelationship between structure and function. Modified beta-lactamse can be used to determine the susceptibility of a particular cantibiotic to hydrolysis le. neutralization by mutant enzymes. Since call possible combinations of mutations were represented within the scope cof the invention, a meaningful sample could be achieved. The method of contain a mutation linker, to determine the number of different colonies present in the library. This can then be used to calculate the present that the most and the least common codon combinations are present to detect and anlyse structure/function relationships.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    R22695
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         30-APR-1992, U07506.

Antigenic polypeptide of non-A, non-B hepatitis virus - for diagnosing non-A hepatitis virus infections, also used as vaccine claim 7; Page 2; 10pp; Japanese.

The sequence given is an antigenic polypeptide of non-A, non-B hepatitis (NANBH) virus. This polypeptide is useful for the detection of NANBH virus antibodies. This antigen can detect the virus antibodies in both the acute phase and chronic phase. The detection of NANBH virus genome using this antigen is very sensitive. Polyclonal and monoclonal antibodies for the detection of the virus antigen and the medical treatment of NANBH, can be prepared using the antigenic peptide. This peptide can be used in the production of a vaccine. Sequence 85 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               NANBH virus antigen.

Antibody; acute phase; chronic phase;
Non-A, non-B hepatitis virus.

useful for diagnosis of hepatitis C virus infection
Claim 1; Page 5; 65pp; Japanese.
The sequences given in R25854-74 are hepatitis C virus protiens.
The genes encoding these proteins can each be used to prepare
recombinant vectors by ligating the gene of interest in to a vector
to be expressed in E. coli. These polypeptides are useful as
diagnostic reagents for type C hepatitis and they may be produced
efficiently by recombinant methods.

Sequence 239 AA;
         Hepatitis C virus antigen expressed as recombinant in E.coliuseful for diagnosis of hepatitis C virus infection Disclosure: Fig 17: 66pp. Japanese.

The sequences given in R25876-95 are encoded by the claimed hepatitis C virus genes of the invention which have been inserted into an E. colivector. These polypeptides are useful as diagnostic reagents for type C hepatitis and they may be produced efficiently by recombinant DNA techniques.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 101
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        21-JAN-1993 (first entry)

The sequences of mRNA encoding HRSV structural proteins are given in Q29627-26. The proteins are F, G, 22K, 9.5K and major capsid protein N. The sequences and encoded proteins are useful for preparing vaccines against HRSV. The vaccines can be used to confer immunity against respiratory tract infections on human subjects. Sequence 194 AA;

pr diagnosing and vaccinating and are highly reactive with the core region of the Hov gene of the thought to acc as antigen determinants and are highly reactive with accinations and are highly reactive with the core also 032435.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             NPI 197-417213/51.

DR NPSDB; 032505. virus gene and its encoded protein - used for PT New hepatitis C virus gene and its encoded protein - used for PT New hepatitis C virus infections protein of the protein vaccinating against hepatitis C virus infections protein superiors given in R29811-906 and R29533 are encoded by various C clones of the NS4-NS5 regions of the Hepatitis C Virus (HCV) gene of C the invention. These NS4-NS5 RNA sequencess were isolated from the C the invention. These NS4-NS5 RNA sequences were isolated RNA serum of a patient suffering from hepatitis C (HC). The isolated RNA cerum of a patient suffering from hepatitis C (HC). The isolated RNA cerum of a patient suffering from hepatitis C (HC). The sequence cofficient of the sequences were converted into CDNA using transcriptase in the presence then amplified using primer pairs. The CDNA sequences isolated C represent different alleles of the same region of the HCV gene.

C contain a highly higher pairs. The converse thought to sequence analysis shows that these clones represent the core region which is not an alpha helix or a beta sheet. These polypeptides are thought to act as antigen determinants and are highly reactive with C antisecrum raised against HCV-associated antigens. See also Q32436.

Virus gene and its encoded protein - used for property of the partitis C virus infections of the partitis C virus (HCV) gene of the sequences given in R29871-906 and R29533 are encoded by various of the invention. These NS4-NS5 regions of the Hepartitis C (HC) which is colated from the clones of the NS4-NS5 regions of the Hepartitis C (HC). The isolated RNA of the invention of a patient sequences were isolated from the crown of a patient sequences given in 032565-77. The sequences were converted into cDNA using transcriptase in the presence of one of the primer sequences given in 032565-77. The sequences were contain amplified using primer pairs. The CDNA sequences isolated trapscriptase in different alleles of the same region of the HCV gene.

Contain a highly hydrophilic region which can adopt a furn structure contains a highly hydrophilic region which can adopt a furn structure with thought to act as antigen determinants and are highly reactive with antigen determinants and are highly reactive with can attagence 171 AA;

PI New hepatitis C virus gene and its encoded protein - used for diagnosing and vaccinating against hepatitis C virus infections protein respectively.
PI New hepatitis C virus gene and R29533 are encoded by various convention. These NA4-NS5 regions of the Hepatitis C virus (HCV) gene of the invention. These NA4-NS5 RNA sequences were isolated from the sequences were converted into cDNA using transcriptase in the presence of one of the primer sequences given in 032565-77. The isolated RNA company of the amplified using primer pairs. The cDNA sequences were then amplified using primer pairs. The cDNA sequences region contain an highly hydrophilic region which can adopt a "turn structure" which is not an alpha helix or a beta sheet. These polypeptides are thought to act as antigen determinants and are highly reactive with cantiserum ratsed against HCV-associated antigens. See also Q32436.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       R29896

PT New gene coding luffin - for missile treatment and prevention of private diseases in agriculture

PT New gene coding luffin - for missile treatment and prevention of the luffin fene of Luffa cDNA coding a propertion of the produce was obtd. by PCR of luffa cDNA coding a PCR primer designed based on the luffin protein sequence coding a PCR primer designed based on the luffin gene can be used in coding a PCR primer designed based on the luffin gene can be used in the luffin may be produced stably, by transforming a microbe such as E. coli coding a propertion of the luffin gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequences given in R29871-906 and R29533 are encoded by various clones of the NS4-NS5 regions of the Hepatitis C Virus (HCV) gene of the invention. These NS4-NS5 RNA sequencess were isolated from the serum of a patient suffering from hepatitis C (HC). The isolated RNA sequences were converted into cDNA using transcriptase in the presence of one of the primer sequences given in Q32565-77. The sequences were then amplified using primer pairs. The CDNA sequences were represent different alleles of the same region of the HCV gene. Sequence analysis shows that these clones represent the core region contain a highly hydrophilic region which can adopt a "turn structure" which is not an alpha helix or a beta sheet. These polypeptides are thought to act as antisen determinants and are highly reactive with antiserum raised against HCV-associated antisens. See also Q32436.

Disclosure; Page 12; 13pp; Japanese. The sequence is that of the prod. of the luffin gene of Luffa cylindrica. The gene sequence was obtd. by PCR of luffa CDNA cylindrica. The gene sequence was obtd. by PCR of luffa cDNA cylindrica pCR primer designed based on the luffin protein sequence using a PCR primer designed based on the luffin gene can be used in from amino acid residues 54.60. The luffin gene can be used in missile treatment and for prevention of viral diseases in agriculture. Intfin may be produced stably, by transforming a microbe such as E. coli with the luffin gene.

                                             Nucleotide sequences hybridising to regions of chicken nov gene useful as probes for detecting complementary sequences to evaluate development and/or differentiation of tumours claim 21; Page 39; 67pp; French.

The chicken nov gene is stimulated in avian nephroblastoma induced pavian myeloblastoma virus but not in normal adult kidney. A laysbe conducted control of the chicken embryonic fibroblasts screened with a tumour-derived from chicken embryonic fibroblasts screened with a tumour-derived from chicken embryonic fibroblasts screened with a tumour-derived probe. Fragment XXII (036044) is part of the 3rd and 4th exons of the nov gene; nucleotide sequences which hybridise to Fragment XXII the nov gene; nucleotide sequences which hybridise to Fragment XXII (181608) or an amino acid sequence 60% homologous to it.

The sequences given in R39259, R39251 and R39253 represent the human somatostatin receptors (SSTR)-1, SSTR-2 and SSTR-3. The DNA encoding these proteins was isolated from total human pancreatic islet DNA. These DNA sequences may be placed under the control of a suitable promoter and used to transform a host cell. The DNA sequences and these proteins may be used in screening assays for testing candidates including agonists and antagonists of SSTR polypeptides. The assays may be used to discriminate candidate substances with desirable properties specific to SSTR polypeptides. The isolated substances may be used in a wide range of aplications eg. diagnosis of various human tumours. Fragments of these DNA sequences may be used as probes in the isolation of other SSTR-encoding clones.
                    Claim 3; Page 65-66; 94pp; English.

The sequences given in R39260, R39262 and R39264 represent the murine somatostatin receptors (SSTR)-1, SSTR-2 and SSTR-3. The DNA encoding these proteins was isolated from total murine pancreatic islet DNA. These DNA sequences may be placed under the control of a suitable promoter and used to transform a host cell. The DNA sequences and these proteins may be used in screening assays for testing candidates including agonists and antagonists of SSTR polypeptides. The assays may be used to discriminate candidate substances with desirable properties specific to SSTR polypeptides. The isolated substances properties specific to SSTR polypeptides. The isolated substances properties specific to SSTR polypeptides. The isolated substances human tumours. Fragments of these DNA sequences may be used as 201 % and 201 % a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        151
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (ARCH-) ARCH DEV CORP.

Claim 3; Page 40; 62pp; English. The sequence is that of Epstein Barr Virus viral capsid antigen VCA-p40 encoded by the EBV open reading frame BdRFI. This antigen is immunochemically reactive with antibodies to EBV and can be used for the diagnosis of EBV in a sample. See also R42316-35.

Recombinant equine herpesvirus' (EHV) have a foreign DNA sequence inserted into their genomes. The inserted sequence is a piece of foreign, double stranded DNA which encodes an RNA molecule which foreign double occur in the animal into which the EHV is does not naturally occur in the animal into which the EHV is introduced. The foreign DNA sequence is introduced into the EHV virus a homology vector. The recombinant EHV's are used to prepare a homology vector horses from infectious EHV. This is the US2 gene product from a recombinant EHV. Recombinant attenuated EHV's sequence 303 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                251

                                              Disclosure: Page 36; 139pp; English. R46981-7038 represent peptide The sequences given in R49291-505 and R46981-7038 represent peptide fragments of naturally-occuring immunomodulatory proteins. These fragments are between 10-30 residues in length and bind to a human fragments are between 10-30 residues in length and bind to a human major histocompatibility complex (MHC) class II allotype. These peptides may be used for therapy of autoinmune diseases, such as peptides may be used for therapy of autoinmune diseases, and to type I diabetes, rheumatoid arthritis and mutiple sclerosis, and to type I diabetes, rheumatoid arthritis and mutiple sclerosis, and to reduce transplant rejection. They may also be used for vaccination providing an exclusively T-cell-mediated response, which can be class I or class II based, or both, depending on the length and length and length and length and length and length are length and length are length and leng

Wovel immunomodulatory peptide(s) and nucleic acids - useful for treatment of auto:immune diseases, transplant rejection and for vaccination

Disclosure; Page 36; 139pp; English.

Disclosure; Page 36; 139pp; English.

The sequences given in R49291-505 and R46981-7038 represent peptide

fragments of naturally-occuring immunomodulatory proteins. These

fragments are between 10-30 residues in length and bind to a human

major histocompatibility complex (MHC) class II allotype. These

peptides may be used for therapy of autoimmune diseases, such as

type I diabetes, rheumatoid arthritis and mutiple sclerosis, and to

reduce transplant rejection. They may also be used for vaccination

providing an exclusively T-cell-mediated response, which can be

class I or class-II based, or both, depending on the length and

commance 34 Ma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           R49297
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Homo sapiens.

The sequences given in R49291-505 and R46981-7038 represent peptide fragments of naturally-occuring immunomodulatory proteins. These fragments are between 10-30 residues in length and bind to a human major histocompatibility complex (MHC) class II allotype. These peptides may be used for therapy of autotimmune diseases, such as type I diabetes, rheumatoid arthritis and mutiple sclerosis, and to reduce transplant rejection. They may also be used for vaccination providing an exclusively T-cell-mediated response, which can be class I or class-II based, or both, depending on the length and character of the immunogenic peptides. 16-SBP-1994 (first entry)

The inventors claim a nucleic acid encoding a polypeptide comprising an AA sequence identical to that of a segment of a naturally-occurring human protein which binds to a human major histocompatibility complex (MHC) class II allotype and a second sequence substantially identical to human II in order to construct such minigenes, overlapping synthetic oligos were used to generate the leader peptide/blocking peptide N-PSDB; Q44334. The sequences given in R50068 and R50070-82 represent antigens of structural and non-structural regions of non A non B hepatitis virus (NANBHY). The CDNA encoding these sequences wase derived from the plasma of a NANBH patient by recombinant DNA techniques. These fragments are useful for the diagnosis of NANBH patients and the detection of NANBHV carriers.

Sequence 352 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SEQUENCE 1.0

protection of glycogen biosynthesis

Disclosure: Page 31, 91pp; English.

The glycogen synthase gene may be incorporated into a plant genome to produce a plant with altered starch synthesising ability. Other genes encoding enzymes involved in the starch or glycogen to biosynthetic pathways may also/additionally be used. The new plants have an improved capacity to produce starch at elevated or lowered temperatures and/or an ability to synthesise starch with an altered fine structure. They can produce higher starch yields at certain temperatures and/or produce starch with an improved quality. The glycogen synthase gene construct used requires the presence of an amyloplast transit peptide to ensure its correct localisation in the amyloplast. This is the consensus sequence of the transit peptide of sequence 56 AA;

The sequences given in R50068 and R50070-82 represent antigens of structural and non-structural regions of non A non B hepatitis virus (NANBHY). The CDNA encoding these sequences wase derived from the plasma of a NANBH patient by recombinant DNA techniques. These fragments are useful for the diagnosis of NANBH patients and the detection of NANBHY carriers.

activity user its user its user or ulcers of ulcers. Claim 15; page 27; 39pp; English.

This sequence is a heparin-binding secretory transforming factor that sequence is a heparin-binding secretory transforming factor (hst-2) polypeptide. It is preferred that the polypeptides of the invention have regions deleted. The polypeptides have cell growth promoting activity and angiogenesis promoting activity and can be used for the treatment of burns, wounds, postoperative tissues or ulcers. The therapeutic composition can be used as a platelet ulcers. The therapeutic radiotherapy and chemotherapy. (Several contents of the contents of the composition can be used as a platelet composition can be used as a platelet.
                                                                                                                                                                                                                                                                                                                                                                                 misc_difference 2. .30 /note- "may be absent"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  involving the receptors.

Involving the receptors.

Example 6; Page 65-66; 100pp; English.

Two Synthetic Oligonucleotides (066165, 066166) were annealed and readiolabelled to produce a V28 specific probe. The probe was denatured by boiling for two minutes and then hybridised to the human placenta genomic library. Several strong hybridising signals were identified and plaque purified and the DNA sequence (066167) of a full length genomic clone encoding this seven transmembrane receptor was deduced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          51

STY2, STY3, STY4 and STY5 cDNAs (given in Q72858-61), encoding peptides having MAP-kinase-phosphatase activity, were derived from human squamous A431 cell polyA+ mRNAs. Residues 177-255 of the encoded STY2-5 peptides were deduced (R63593-96) and demonstrated to show homology with the corresponding region of the previously isolated human CI100 gene product (R63592).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    09-MAY-1995 (first entry)

STY8 CDNA (given in Q72864), encoding a peptide having
MAP-Kinase-phosphatase activity, was derived from a human
brain cDNA library. The STY8 protein (R63601) encoded by this
full-length cDNA showed homology to the previously isolated
human CL100 gene peroduct (R63602).

CC Inhibitor (AI) family. By size and electrophoretic measurements,

CC inhibitor (AI) family. By size and electrophoretic measurements,

CC this protein has been called 0.26 AI. The protein was isolated from

CC wheat extracts by a novel process comprising (1) extracting a

CC wheat-based material to produce a solution containing the AI; (ii)

CC optionally purifying the solution to remove contaminants using a cation

CC exchanger to absorb the AI, (iii) treating this exchanger with alkali

CC at pH 9-13 to elute the AI, (ii) immediately adjusting the pH of the

CC elute within neutral or acid range and (v) recovering the AI from this

CC solution. The novel AI has a very high inhibitory activity against an

CC amylase especially human pancreatic alpha-amylase. The activity of

CC the AI is 5-30 times higher than other amylases of wheat origin such as

CC 0.53 AI or 0.28 AI. The protein occurs as a homodimer with subunits of

CC molecular masses 12500. The protein can be used in combination with

CC another amylase inhibitor (0.19) (R58656) as an agent for inhibiting

CC suppressing appetite, and as a food additive, the total content of both

CC proteins in the material being at least 20% by weight.

New amylase inhibitor and process of prepn. from wheat -
useful for inhibiting increase in blood glucose level,
controlling insulin secretion, suppressing appetite and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Amylase inhibitor protein 0.26 AI.

Amylase inhibitor; wheat; cation exchange; inhibitor; amylase;
pancreatic, alpha-amylase; homodiner; blood glucose level;
insulin secretion; appetite; food additive.

CC family. By size and electrophoretic measurements, this protein is called
CO.19 AT. The protein occurs as a homodimer, the subunits having the amino
acid sequence given. This protein can be used in combination with a
convel amylase inhibitor (0.26) (RS8635) as an agent for inhibiting
CI increase in blood glucose level, controlling insulin secretion or
CI suppressing appetite, and as a food additive, the total content of both
CI proteins in the material being at least 20% by weight. The novel protein
CI proteins in the material being at least 20% by weight. The novel protein
CI proteins in the material being at least 20% by weight. The novel protein
CI proteins in the material being at least 20% by meight and containing
CI proteins in the material being at least 20% by meight. The novel protein
CI proteins in the material being at least 20% by meight and containing
CI protein in the axionally purifying the solution to remove contaminants
CI using a cation exchanger to absorb the AI, (ii) treating this exchanger
CI with alkali at pH 9-13 to elute the AI, (ii) immediately adjusting the pH
CI of the elute within neutral or acid arong and (v) recovering the AI from
CI and anylase especially human pancreatic alpha-amylase. The activity of
CI the AI is 5-30 times higher than other amylases of wheat origin such as
CI Sequence 124 as.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   T 15-MAY-1995 (first entry)

DNA coding NAD synthetase - used for the prepn. of NAD synthetase Claim 2; Column 17-20; 16pp; Japanese.

The amino acid sequence for the N-terminal region of nicotineamide adenine dinucleotide (NAD) synthetase (NADS). The gene encodes a protein of 245 amino acids. The gene was inserted into E.coli in an expression plasmid. This was used to produce the NADS protein. This method allows the efficient preparation of NADS polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      _SEQUENCE 1.0

Plasmid pp54 is a pvictoriv deriv. in which a 3 kb KpnI fragment contg. the construct;

contg. the construct;

patatin promoter - spinach rubisco activase transit peptide - small subunit AGP from barley endosperm - 35S terminator; is inserted in the KpnI site. R63443 gives the N-terminal sequence of the rubisco activase-AGP small subunit fusion enzyme. ppp54 is inserted.
                                                                                                                                                                                                                                                                                                                                                                                                                                             Amino terminal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     06-JUN-1995

The sequence is that of the product of the porcine Gal-alpha (1,3) galactosyl transferase gene which produces a Gal epitope on the surface of porcine cells. This epitope is recognised by antibodies which are responsible for hyperacute rejection of xenotransplanted pig cells, tissues and organs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Galactosyl transferase 3 (Galactosyl Gal-alpha (1,3) galactosyl
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sus scrofa domestica.

                                                                                                                                                                                                                                                                                                                                           coning molecule.

Claim 11(b): Column 26: 23pp; English.

Claim 11(b): Column 26: 23pp; English.

An immunological carrier complex comprises an epitope-bearing molecule bound to the rotavirus inner capsid protein VP6 (given molecule bound to the rotavirus inner capsid protein VP6 (given molecule bound to the rotavirus inner capsid protein VP6 (given molecule bound to the rotavirus in R66664-8. Reptide B (or 84 TS) (R66665) is derived from rotavirus VP3 (231-254).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 18-MAR-1994; U03019.

Example 2; Column 18: 23pp: English.

An immunological carrier complex comprises an epitope-bearing molecule bound to the rotavirus inner capsid protein VP6 (given in R6669) using a binding peptide such as peptide B (84 TS) (R66659) variants of peptide B were also tested for binding to vonly those that generated a spatial arrangement of cys and Argresidues in a suitable 3-dimensional orientation (e.g. R6666-68) were suitable. 84 TS-CYS (R66680) did not bind to VP6.
                                                                       20-JUL-1995 (first entry)

                                                                                                                                                                                                                                                                                           An immunological carrier complex comprises an epitope-bearing molecule bound to the rotavirus inner capsid protein VP6 (given in R66669) using a binding peptide such as peptide B (84 TS) (R6665). Variants of peptide B were also tested for binding to VONLY those that generated a spatial arrangement of Cys and Arg residues in a suitable 3-dimensional orientation (e.g. R66666-68) were suitable. MONOSER (R66682) did not bind to VP6. Sequence 25 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SEQUENCE 1.0

PPI Enzyme with pectin methylesterase activity - useful for price of pectin, e.g. for application in food industry. Price demethylation of pectin, e.g. for application in food industry. Price demethylation of pectin, e.g. for application in food industry.

PRI Enzyme with pectin methylesterase activity - useful for demethylation of general personners an enzyme showing pectin methylesterse (PME) of Strain CBS 101.43. The PME enzyme is useful for demethylation of cotivity. The DNA sequence encoding this protein was isolated from CC strain CBS 101.43. The PME enzyme is useful for demethylation of cotivity. The DNA sequence used in the food industry for fruit and composition. It can therefore be used in the food industry for fruit and vegetable processing. It modifies plant cell walls and can be used to improve the firmness of a pectin-contg. material or to increase viscosity of a pectin-contg. material. CC contg. material or to increase viscosity of a pectin-contg. material. CC contg. material or to increase viscosity of a pectin-contg. material.                                                        R67596
                                            Transgenic plant material with plastid(s) contg. the enzymes for synthesis of poly:hydroxy:alkanoate(s) - express poly:hydroxy:butyrate and have good growth and seed formation. Claim 2: Page 60-61: 88pp. English.

The acetyl-CoA-reductase gene (phbB) from A. eutrophus is cloned conder the control of an Arabidopsis thaliana seed storage protein conder the control of an Arabidopsis thaliana seed storage protein conderer for plastid tissue-specific gene expression in a conderer for plastid tissue-specifically poly-beta-conderer for plastid tissue-specifically poly-beta-conderer for plastid plastic plant (preferably a Brassica e.g. rape). PHB and related PHAs are conderer for plastid thermoplastics with many useful applications. Sequence 329 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           17-AUG-1994; U09265;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          101
                                                                                                                                                                                                                                                                                                                                                                             resistant to virus infection

Claim 1; Fig 14; 92pp; English.

The amino acid sequence encoded by the open reading frame 3 of the real sequence encoded by the open reading frame 3 of the resultant product was amplified by lettuce infectious yellows virus (LIYV) RNA 1. The gene was amplified by PCR using the primers Q83175-6. The resultant product was used to construct expression casesttes expressing the gene as a sense (pEPG170) message. The vectors containing the cassettes can be transformed into marginate the vectors containing the cassettes can be transformed into containing the sense or antisense vectors are resistant to LIYV infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Lettuce infectious yellows virus open reading frame 3 protein. Expression vector; expression cassette; Agrobacterium tumefaciens; plant; lettuce infectious yellows virus coat protein; amplify; PCR; primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     301

Chiang CH, Cochran MD;
region not essential for replication - used in vaccines to protect horses from infection

Example 11; Pages 86-87; 159pp; English.

T00531 encodes R84103 the equine herpesvirus 1 (EHV) unique short 2
(US2) gene prod. A recombinant attenuated EHV can be produced by deleting the above US2 gene (a region not essential for replication) from the viral DNA. The attenuated virus can be used as a foetal safe vaccine to protect an equine against EHV, or in a test to determine if an equine has been vaccinated against or is infected with EHV.

I leukocyte adnesion to environment.

T inflammatory disease property in flammatory chain variable in flammatory disease property in flammatory disease antibody 21.6 heavy chain variable region. Ha, directed against leukocyte adhesion molecule via 4. Cloned region, Ha, directed against leukocyte adhesion molecule via constant regions in the construction of a humanized in linked to human constant regions in the construction of a humanized modified using PCR primers (See 099895-98) and then subcloned into modified using PCR primers (See 099895-98) and then subcloned into constant regions. In the humanized light chain, amino acids L45, constant regions. In the humanized light chain, anion acids L45, last and L69 in the humanized light chain, anion acids L45, last anion acid present in the equivalent position of the mouse by the amino acid present in the equivalent position of the mouse cbus the amino acid present in the equivalent position of the mouse by the amino acid present in the equivalent position of the mouse cbus are constant property of the mouse are constant property of the mouse of the mouse constant property of the mous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    R81323

```
The sequence represents the mouse antibody 21.6 heavy chain variable CC region directed against leukocyte adhasion molecule VLA-4. Cloned CC cDNA sequences of mouse 21.6 VH and VL (see 69989) regions are constant regions in the construction of a humanized CC antibody against VLA-4. The 5 and 3 ends of the mouse cDNAs are CC modified using PCR primers (See 099895 98) and then subcloned into CC constant regions. In the humanized heavy chain, amino acids H27. CC constant regions. In the humanized heavy chain, amino acids H27. CC constant regions to the humanized heavy chain, amino acids H27. CC constant regions. The humanized heavy chain, amino acids H27. CC constant regions. The humanized heavy chain and could the mouse could be the amino acid present in the equivalent position of the mouse CC lass. H29, H30, H44 nd H71 in the equivalent position of the mouse CC lass into COS cells. The humanized antibodies can be used to inhibit adhesion of a leukocyte to an endothelial cell and to treat inflammatory diseases such as multiple sclerosis. They can also be used in the treatment of stroke, cerebral traumas, CC can also be used in the treatment of stroke, cerebral traumas, CC anti-iduotype antibodies.

CC The sequence represents the mouse anti-VLA-4 antibody 21.6 heavy chain constraint framework regions of the Rel antibody for the light chain and constant framework regions of the Rel antibody for the light chain and constant framework regions of the Rel antibody for the light chain and constant framework regions of the Rel antibody for the light chain and constraint for the light chain and constant framework regions of the Rel antibody for the light chain and constraint regions. In the humanized light chain, amino acids L45, L49, constant regions. In the humanized light chain, amino acids L45, L49, constant regions. In the humanized light chain, amino acids L45, L49, constant regions. In the humanized light chain, amino acids L45, L49, constant regions. In the humanized light chain acids L45, L49, constant regions. In the humanized light chain acids L45, L49, constant regions. In the humanized light chain acids L45, L49, constant regions. In the humanized light chain acids L45, L49, constant regions. In the humanized light chain acids L45, L49, constant regions. In the humanized light chain acids L45, L49, constant regions. In the humanized light chain acids L45, L49, constant regions. In the humanized lation of a leukocyte constant regions. In the humanized lead in the treatment of stroke, constant regions are not provided acids and lation or for generating constant regions and lation or for generating constant regions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          R81330 Length: 123

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      variable framework
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        variable complementarity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          complementarity
```

```
The sequence represents the human reshaped antibody 21.6 heavy chain variable region against leukocyte adhesion molecule VLA-4. Cloned cDNA sequences of mouse 21.6 VH (099892) and vI (099889) regions are linked to human constant regions in the construction of a humanized antibody against VLA-4. The 5 and 3 ends of the mouse cDNAs are modified using PCR primers (099895-98) and then subcloned into mammalian cell expression vectors containing human subcloned into mammalian regions. In the humanized heavy chain, kappa or gamma-1 constant regions. In the humanized heavy chain, amino acids H27, H28, H29, H30, H44 and H71 in the human HC VR framework are replaced by the amino acid present in the equivalent position of the mouse 21.6 Ig H chain. Plasmids encoding the chimeric antibodies are transfected into COS cells. The humanized antibodies can be used to inhibit adhesion of a leukocyte to an endothelial cell and to treat inflammatory diseases such as multiple sclerosis. They can also be used in the treatment of stroke, also be used for detecting VLA-4, for affinity purification or for generating anti-1dioryce antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          27-JUL-1995

!!AA_SEQUENCE 1.0
NA encoding tyrosine phosphatase MPTP delta - useful for DNA encoding tyrosine phosphatase MPTP delta - useful for elucidation of signal transmission mechanisms.

Claim 2; Page 11-12; 14pp; Japanese.

The sequences given in R75202-03 are encoded by insertion sequences which were included in the tyrosine phosphatase MPTP-delta coding sequence. The INS-1 CDNA was inserted between the 65th A and the 67th G of the MPTP-delta coding sequence, and the INS-2 CDNA was inserted between the 1194th A and the 1195th T of the sequence. The MPTP-delta sequence was isolated from murine brain tissue and was cloned, for expression, into the downstream region of a glutathione-S-transferase sequence and expressed as a fusion protein in E. coli. MPTP-delta
                                                                                                                                                                                                                                                                                                                                                                                                               10-MAY-1996 (first entry)
